# conjur

**Authorization platform for the cloud**

Hleb Rubanau, LVEE 2014

# **conjur** Infrastructure moves to the cloud: challenges

---

# **conjur** Infrastructure moves to the cloud: challenges

---

✓ Authentication (Who are you?)

# **conjur** Infrastructure moves to the cloud: challenges

---

- ✓ Authentication (Who are you?)
- ✓ Authorization (Are you allowed to do this?)

# conjur Infrastructure moves to the cloud: challenges

---

- ✓ Authentication (Who are you?)
- ✓ Authorization (Are you allowed to do this?)
- ✓ Audit (Who did this?)

## conjur Old approaches are revisited

---

- ✓ Perimeter-based security... is no more
- ✓ Scripts and services are powerful actors
- ✓ Lots of credentials to third-party services are used
- ✓ Data should be encrypted... but where keys are stored?
- ✓ **Compliance requirements make it all even harder**

# conjur The Authorization Challenge

---

Authorize these

Users

Web Services

Code

To use these

Web Services

Apps

APIs

Databases

IaaS

## New Frontiers of Identity

- ◁ Web and mobile users
- ◁ Cloud/PaaS consoles and APIs
- ◁ Web services, scripts, code and other “robots”

## New Kinds of Assets

- ◁ Virtual machines & lightweight containers
- ◁ 3rd party and hosted services
- ◁ Widely dispersed geography

## Separate appliance, which encapsulates:

- ✓ Directory of users, “robots”, their roles and permissions
- ✓ Encrypted access-controlled containers for sensitive data
- ✓ Audit trail

## Interfaces exposed:

- ✓ HTTPS REST
- ✓ LDAPS (partially, to fit the needs of ssh management)

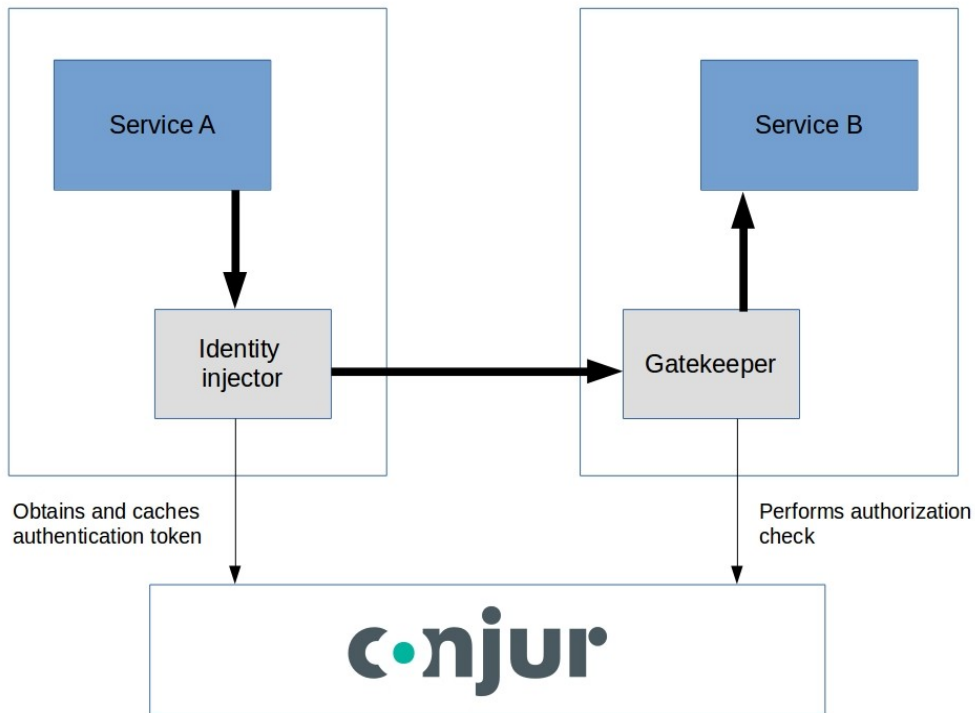

# conjur Use Case #1: Service to service authorization

---

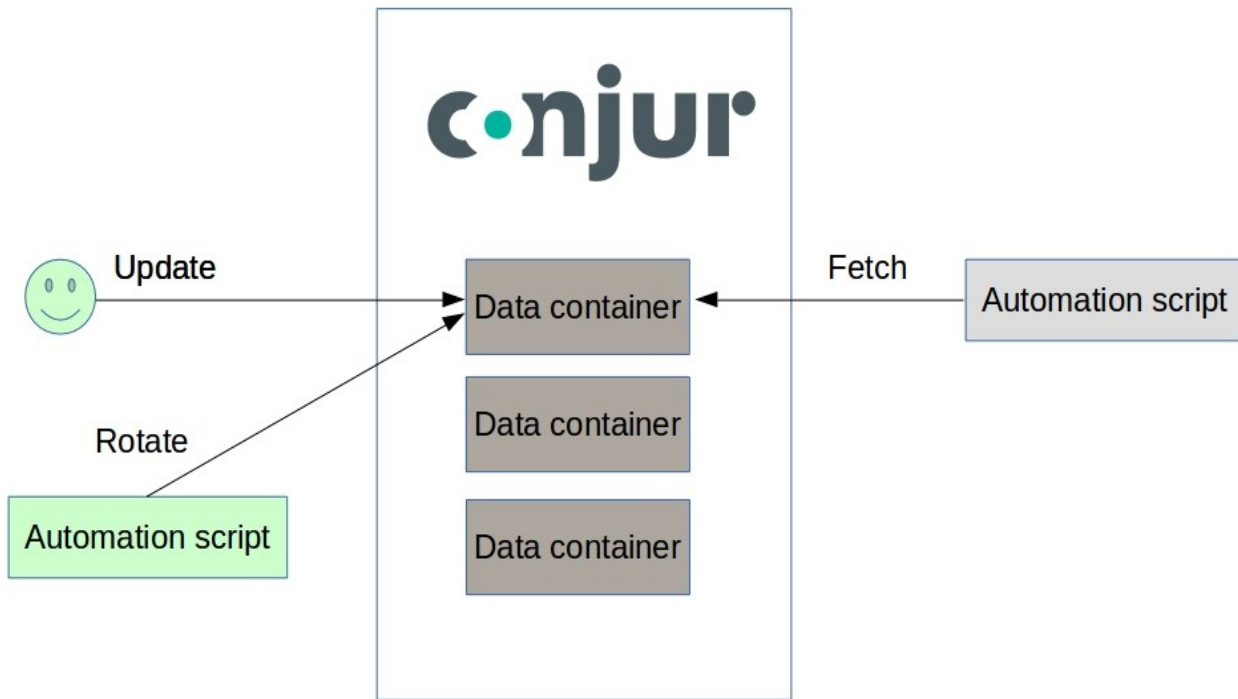

# conjur Use Case #1: Service to service authorization

---

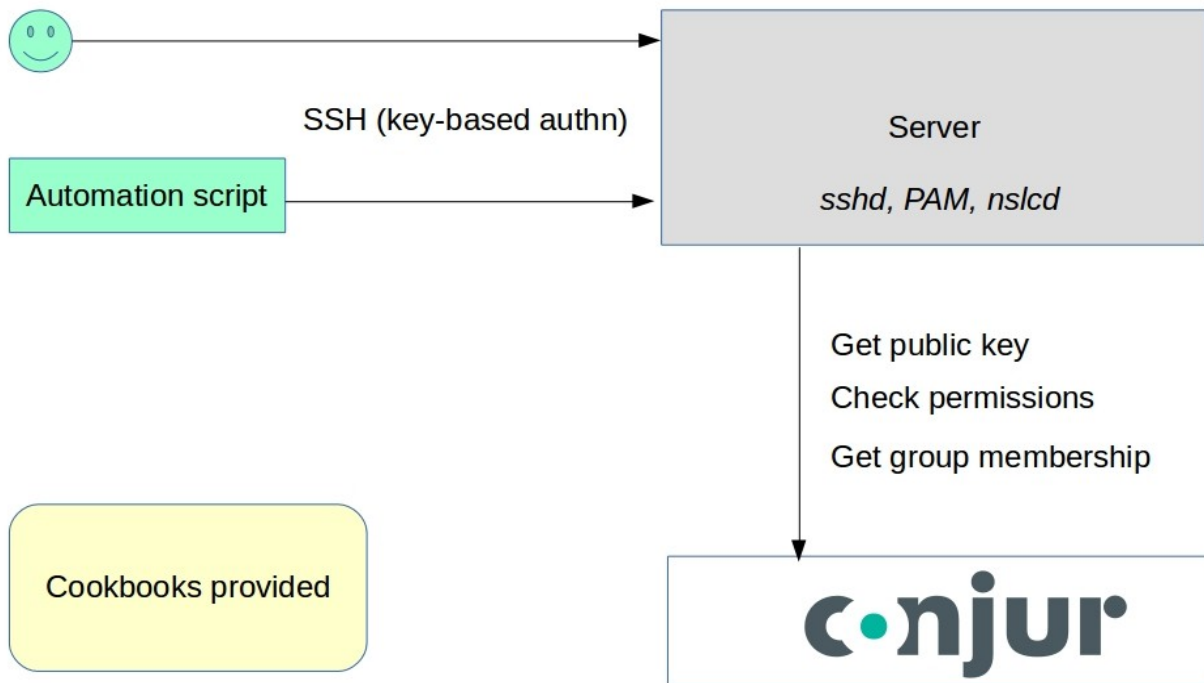

# conjur Use Case #2: Secrets management

---

# conjur Use Case #3: SSH access orchestration

## conjur Devops' view

---

- ✓ Command-line driven
- ✓ Fully-accessible REST API
- ✓ Client library for Ruby, more in development
- ✓ Scalable HA deployments supported
- ✓ CF recipes (cookbooks, etc.) are part of the product
- ✓ Low-level protocols: standard open-source only

## conjur Developer's insight

---

- ✓ Postgres, Ruby, Cucumber, Rspec, Chef
- ✓ For outer world (constantly improving): recipes for Chef, Puppet, Saltstack, CloudFormation... and more in plans
- ✓ Test-driven development, Jenkins-managed CI
- ✓ Cloud-oriented
- ✓ Git just works

## **conjur** Some facts about the company

---

Massachusetts-based startup, with investments and paying customers

Considered as prospective by guys from PuppetLabs, Opscode (Chef), Netflix

Small distributed horizontal team, freelance-style collaboration

We look for smart guy (or two?) in Minsk :)
